The according osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis claim 8; page 128-129; 188pp; Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-CSph in which amino acids 298-380 of the mature COIF protein are replaced by Ser-Leu-Asp. These changes are caused by the introduction of a restriction site in the DNA encoding this protein. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducting conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.c or 30 mins at 56 deg.c, and is lost after 10 mins at 90 deg.c. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g. osteoporosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis claim 47, Page 107-109, 183pp; Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-DCR2 in which amino acids 43-84 of the mature OCIF protein are deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C. or 30 mins at 56 deg.C, and is lost after 10 mins at 470 deg.C. ocif is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                           osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-DCR4 in which amino acids 123-164 of the mature OCIF protein are deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C. or 30 mins at 56 deg.C, and is lost after 10 mins at 70 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            23-APR-1997 (first entry)
Mutated OCIF, OCIF-DCR2.
Osteoclastogenesis inhibitory factor; OCIF; heparin; bone resorption;
                                                                               DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis Claim 53; Page 111-113; 183pp; Japanese.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis (laim 65; Page 119-121; 183pp; Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-CC in which amino acids 331-380 of the mature OCIF protein are deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C. or 30 mins at 56 deg.C, and is lost after 10 mins at 70 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mutated OCIF, OCIF-DCR4.

                                                                                                                                                                                                                                                                                                                                            DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis claim 50. Page 109-111; 183pp; Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-DCR3 in which amino acids 85-122 of the mature OCIF protein are deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto action-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C. Or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

for bone resorption control, esp. treatment of osteoporosis.
Claim 44; Page 105-107; 183pp; Japanese.
This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents oCIF-DCRI in which amino acids 2-42 of the areure oCIF protein are deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto action-exchangers or hepzin and its activity is lowered after 10 mins at 70 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ô

Mature osteoclastogenesis inhibitory factor.
Osteoclastogenesis inhibitory factor; OCIF; heparin; bone resorption;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           In the encoding osteoclastogenesis inhibitory factor, protein - useful for bone resorption control, esp. treatment of osteoporosis claim 6; Page 62-64; 183pp; Japanese.

This sequence represents the mature osteoclastogenesis inhibitory factor (OCIF) of the invention. The OCIF has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                     DNA encoding osteoclastogenesis inhibitory factor protein - useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 .

Claim 14: Fig 1: 59pp: English.
The receptor binds to TNF, and in particular, TNF-beta.
The receptor may be used for screening for antagonists and agonists of the receptor and for ligands for the receptor. Such agonists be used to inhibit the growth of tumours, to stimulate cellular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

Tumour necrosis facor; TNF; receptor; TNF-beta; ligand; tumour;
differentiation; immune response; autoimmune disease; inflammation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   differentiation, to mediate the immune response and anti-viral response, to regulate growth and provide resistance to certain infections. The antagonists may be used therapeutically, to treat autoimmune diseases, inflammation, septic shock, to inhibit graft-versus-host reactions, and to prevent apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New human tumour necrosis factor receptor - used to develop prods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .

                                                                                            osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-CBst in which Gln 371 is substituted by leu and amino acids 373-380 of the mature OCIF protein are deleted. These changes are caused by the introduction of a restriction site in the DNA encoding this protein. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg. C. and Mins at 56 deg. C, and is lost after 10 mins at 90 deg. C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Mutated OCIF, OCIF-CL.
Osteoclastogenesis inhibitory factor; OCIF; heparin; bone resorption; osteoporosis.

                                                                                                                                                                                                                                                                                  DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis claim 38; Page 100-102; 183pp; Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-C22S in which the 23nd Cys residue in the mature OCIF protein is substituted by Ser. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation exchanges or heparin and its activity is lowered after 10 mins at 70 deg. C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the protein and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ò

DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis Claim 3.7 Page 96-98; 183pp; Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-C20S in which the 20th Cys residue in the mature OCIF protein is substituted by Ser. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 70 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis claim 41, Page 103-105, 183pp; Japanses.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-C23S in which the 23rd Cys residue in the mature OCIF protein is substituted by Ser. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 70 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Osteoclastogenesis inhibitory factor; OCIF; heparin; bone resorption;

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents offreci9s in which the 19th Cys residue in the mature OCIF protein is substituted by Ser. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                     DNA encoding osteoclastogenesis inhibitory factor protein for bone resorption control, esp. treatment of osteoporosis Claim 29; Page 94-96; 183pp; Japanese.

                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-C21S in which the 21st Cys residue in the mature OCIF protein is substituted by Ser. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the control of bone resorption of circums.
                                                                                  22-APR-1997 (first entry)
Mutated OCIF, OCIF-C21S.

This sequence represents the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. The OCIF has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                          DNA encoding alternatively spliced prostate-specific membrane antigen - useful to develop prods. for detecting haematogenous micromenestic tumour cells, or prostate cancer progression Example 1; Page 49; 284pp; English.

Tryptic peptides (W02237-45) were obtd. from the human prostate-specific membrane (PSM) antigen (see also W0224) and used to design primers (T36795-808) utilised in the isolation of a CDNA clone (T36785) coding for PSM; primers 1.L (T36801.04) are based on amino acids 14-19 of peptide 2734 6 (W02241). The isolated CDNA and PSM protein are useful in developing methods for the diagnosis and treatment of prostate cancer and metastasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Prostate-specific membrane antigen peptide fragment.

Avaluation of safety of a chemical cpd. - using recombinant yeast
expressing human cytochrome p450 and a yeast NADPH-P450 reductase
Examples; Page 49-51; 124ppp. English.

Examples; Page 49-51; 124ppp. English.

The amino acid sequence of the human auxillary cytochrome P450 species

2A6. The cDNA was amplified by PCR using the primers Q87751-4. The
product was coloned into the yeast expression of the cytochrome P450 alone
or p2A6R for co-expression with the yeast NADPH-P450 reductase.

The vectors are used in a method for evaluating the safety of a chemical
compound by reacting the chemical compound with recombinantly produced
human cytochrome P450 molecular species 1A2 (Q87714), 2C9 (Q87718-3), and yeast NADPH-P450 reductase, either as a fused protein or
in cellextracts, and analysing the resulting metabolite to assess the
safety of the chemical compound. The method is useful for determining
whether the chemical compound, or its metabolite, will be converted into
sequence 494 AA.
The inventors attempted to sequence the PSM Ag by modified Edman degradation. Peptides (R55098-107) that gave clear dominant peaks on HPLC from the digested PSM Ag sample were used. Some of the residues were unidentified, and others were present at very low levels and identified with lower confidence. Some of these peptides were used to design primers to carry out PCR to identify cDNA clones were used to design primers to carry out PCR to identify cDNA clones canceding the PSM Ag. R55102 was used to design primers Q65527-30.

A clone, IN-20 was identified as a partial PSM sequence. The full PSM Ag sequence is shown in R55097 and is encoded by Q65520). The PSM coding sequence is useful for suppressing or modulating the metastatic ability of prostate tumour cells to grow, or for eliminating them. The PCR is useful to identify or purify ligands of the Ag. It is also an attractive target for Ab-directed imaging and targeting of prostatic tumour deposits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human auxillary cytochrome P450 species 2A6 protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 For a variant of safety of a chemical cpd. - using recombinant yeast expressing human cytochrome p450 and a yeast NADPH-P450 reductase Examples; Page 53-55, 124pp; English.

Examples; Page 53-55, 124pp; English.

The amino acid sequence of the human auxillary cytochrome P450 species 2A6 variant 1. This variant contains a variation at residue 476. And to Lys, caused by a variation at base 1427. G to A in the DNA sequence. The CDNA was amplified by PCR using the primers (87751-4. The product was cloned into the yeast expression vectors pAAHSN or pAHRR to produce the vectors p2A6 variant 1 for the expression of the cytochrome P450 alone or p2A6R variant 1 for the expression with the yeast NADPH-P450 reductase. The vectors are used in a method for evaluating the safety of a chemical compound by reacting the chemical compound with recombinantly produced human cytochrome P450 molecular species 1A2 (087714), 2C9 (087715), 2E1 (087716), or 3A4 (087718), or their auxillary species and variants of callextracts, and analysing the resulting metabolite to assess the safety of the chemical compound, or its metabolite, will be converted into a carcinogenic or mutagenic form through metabolism in the liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    11-007-1996 (first entry)

Novel method for the evaluation of the safety of a cpd. - using a human cytochrome P450 and yeast NaDPH reductase to determine whether the manalyte cpd. is detoxified or metabolised to a carcinogen Example 1; Page 33-35; 74pp; Japanese.

Comparison of the amino acid sequence of the human cytochrome P450 molecular species 2A6 variant #1 protein. The corresp. gene was amplified from a comman liver derived cDNA library as 2 fragments of 0.6 and 0.9 kb using primers 126941-44. The prod. was cloned into the yeast expression vector pAHRR to generate plasmid p2A6 for prodn. of the cytochrome only or into the vector pAHRR to generate the plasmid p2A6 for prodn. of the cytochrome only or into the vector pAHRR to generate the plasmid p2A6 for prodn. of the cytochrome only or into the vector pAHRR to generate the plasmid p2A6 for prodn. of the cytochrome only or into the vector pAHRR to generate the plasmid p2A6 for prodn. of the cytochrome only or into the vectors are used in a method for evaluating the safety of a cpd. by reacting the test cpd. with recombinantly produced human cytochrome P450 compared protein or as a cell (128381), 2E1 (128382), 3A4 (128383) or their variants (128384-98) together with yeast NaDPH-P450 reductase carbitant metabolite. The cpd. is considered safe" if it is not detoxified or is metabolised to a carcinogenic or "unsafe" if it is not detoxified or is metabolised to a carcinogenic or "unsafe" if it is not detoxified or is

Human derived cytochrome, P4502A6.
Human derived cytochrome, P4502A6; commercial cDNA library; yeast;
transfection; recombinant production; expression vector; mammal;
immunisation; sensitisation; antibody; determination; detection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antibody recognising human derived cytochrome P4502A6 - allows specific detection of cytochrome P450 species in humans S Example 1.9 Pages 11-13; 13pp; Japenese.

The present sequence is the human derived cytochrome (HDC) P4502A6, which was obtd. from a commercial cDNA library. Yeast C were transfected with an expression vector confg. the HDC cDNA, cultured and then discupted to qive a microsomal fraction. The HDC was purified from the fraction, and used to immunise and ansensitise a mammal. Blood was drawn from the mammal, and an anti-HDC antibody isolated The antibody obtd. recognises HDC P4502A6, partic. at a serum dilution rate of 1:10000, and is substantially without cross reaction to other HDC P450 spp..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

To uning the terminal differentiation of keratinocytes, this protein if the terminal differences cross-linked to membrane proteins by transglutaminase and incorporated into an insoluble, cross-linked envelope under the plasma membrane.

FICATION #superfamily involucin confidence confidence cell envelope; duplication; epidermis; tandem

REPLICATION PROTEIN E1. [1] SEQUENCE FROM N.A. MEDLINE; 94265501. RESULT

```
C -1 DEVELOPMENTAL STAGES WILLST THE SHORTER FORM, E78B, IS EXPRESSED ONLY
IN MID-PUPAL STAGES, WHILST THE SHORTER FORM, E78B, IS MAXIMALLY
EXPRESSED IN NEWLY FORMED PREPUPAL.

-1 INDUCTION: BOTH FORMS REQUIRE ECDYSONE FOR ACTIVITY. E78B ALSO
REQUIRES ECDYSONE-INDUCED PROTEINS FOR MAXIMAL EXPRESSION.

-1 ALTERNATIVE PRODUCTS: THE DIFFERENT FORMS OF PROTEIN E78 ARE
PROBABLY PRODUCED BY ALTERNATIVE SPLICING OF THE SAME GENE.

-1 SIMILARITY: TO OTHER MEMBERS OF THE STEROID/THYROID/RETINOIC

NUCLEAR HORWONE RECEPTORS.

Page 113-114; 183pp; Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents ociF-DDD1 in which amino acids 178-252 of the mature OCIF protein are deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kb under reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.

DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis Claim 59; Page 115-116; 183pp; Japanese.
This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-DDD2 in which amino acids 253-326 of the mature OCIF protein are deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions: The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Natural 193109.

To bone resorption control, esp. treatment of osteoporosis for bone resorption control, esp. treatment of osteoporosis for bone resorption control, esp. treatment of osteoporosis for sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-DCR4 in which amino acids 123-164 of the mature OCIF protein are deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C. or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the control of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Osteoclastogenesis inhibitory factor; OCIF; heparin; bone resorption; osteoporosis.

DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis Claim 47, Page 107-109; 183pp; Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-DCR2 in which amino acids 43.84 of the mature OCIF protein are deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C. or 30 mins at 56 deg.C, and is lost after 10 mins at 70 deg.C. OCIF is useful in the control of bone resorption and therefore in the control of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 23-APR-1997 (first entry)

Introduce to select a stogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis claim 50. Page 109-111, 183pp; Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-DCR3 in which amino acids 85-122 of the mature OCIF protein are deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the control of disorders of bone resorption, e.g.
                                                                                                                          ON encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis claim 44; Page 105-107; 183pp; Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-DCR1 in which amino acids 2-42 of the mature OCIF protein are deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C. deg.C. or 10 mins at 56 deg.C. deg.C. or 10 mins at 56 deg.C. or 10 mins at 60 deg.C. or 60 mins at 60 deg.C. or 60 deg.C. or 60 deg.C. or 60 deg.C. or 60

DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis claim 80. Page 126-128; 183pp. Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents a mutated version of the invention. This sequence represents to which Gln 371 is substituted by Leu and amino acids 373-380 of the mature OCIF protein are deleted. These changes are caused by the introduction of a restriction site in the DNA encoding this protein. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore an analyse of the control of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      No. According osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis Claim 62. Page 117-119; 183pp; Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-CL in which amino acids 379-380 of the mature OCIF protein are deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

                                                                                                                                                                                                                                                                                      DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoprosis claim 38, Page 100-102, 183pp; Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-C22S in which the 27nd Cys residue in the mature OCIF protein is substituted by Ser. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 degr. Ocif is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            22-APR-1997 (first entry)
Mutated OCIF, OCIF.20S.
Osteoclastrogenesis inhibitory factor; OCIF; heparin; bone resorption; osteoporosis.

NA encoding osteoclastogenesis inhibitory factor protein - useful protein control, esp. treatment of osteoporosis for bone resorption control, esp. treatment of osteoporosis Claim 41: Page 103-105; 183pp; Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCTF) of the invention. This captence represents OCTF-C23S in which the 23rd Cys residue in the mature OCTF protein is substituted by Ser. The OCTF of the invention of has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins of at 70 deg. C. or 30 mins at 56 deg.C. and is lost after 10 mins at 90 deg.C. OCTF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g. osteoporosis.
                                                                                                                                                                                                   This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents oCIF-C20S in which the 20th Cys residue in the mature OCIF protein is substituted by Ser. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Mutated OCIF, OCIF-C23S.

                                                                                                            DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone rescrition control, esp. treatment of osteoporosis Disclosure; Pege 64-66; 183pp; Japanese.

This sequence represents the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. The OCIF has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or useful in the control of bone rescription and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

Mean 25.879; Variance 44.392; scale 0.583 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Comparative amino acid sequence analysis of Thermotoga
maritima Beta-glucosidase BglA deduced from the nucleotide
sequence of its gene indicates distant relationship between
family BGA Beta-glucosidases and other families of Beta-1
4-glycosyl hydrolases.

HOLLEIC ACIDS RES. 18:5545-5545[1990].
- I- FUNCTION: PROMOTES COLLOIDOSONOTIC LYSIS BY BINDING TO THE MIDGUT
- PUNCTION: PROMOTES COLLOIDOSONOTIC LYSIS BY BINDING TO THE MIDGUT
- PUTLELLAL CELLS OF MANY LEPHDOPPERAN LARVAE.
- TOXIC SEGMENT OF THE PROTEIN IS LOCATED IN THE N-TERMINUS.
- I- TOXIC SEGMENT OF THE PROTEIN IS PRODUCED DURING.
- POPULANTION AND IS ACCUMULATED BOTH AS AN INCLUSION AND AS PART

FATHI Z., IBEN L.G., PARKER E.M.;
NEUROCHEM. RES. 20:107-113(1994).
-!- FUNCTION: RECEPTOR FOR MSH (ALPHA, BETA AND GAMMA) AND ACTH. THE
ACTIVITY OF THIS RECEPTOR IS MEDIATED BY G PROTEINS WHICH ACTIVATE
ADENYIANTE CYCLASE. THIS RECEPTOR IS A POSSIBLE MEDIATOR OF THE
IMMUNOMODULATION PROPERTIES OF MELANOCORTINS.
-!- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.
-!- TISSUE SPECIFICITY: IS EXPRESSED IN THE BRAIN BUT NOT IN THE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 U58 OR 5R.
